How to fix a server (IO) error?

I am trying to upload an image and I have tried various sites and image types but it never completes uploading and says server (IO) error. I have never had a problem with uploading before. How do I fix this problem? I really want to get it sorted out.

An input output error could be a read/write issue with the hard drive in the server. I would run a test on the hardware (particularly the hard drive) to see if it is functioning properly.
